Market Comment

Markets after five months of consecutive rises, the main equity markets took a breather, a break in a month that went from better to worse and where we saw widespread declines due to a number of factors that turned the market's previously discounted outlook upside down. Although the market demonstrates time and again its ability to adapt to any adverse scenario that may arise, as we have seen lately with the global geopolitical situation, we should not avert our eyes from a negative impact on the economic evolution due to the surprising consequences that this or other subsequent conflicts may have. The last CPI data published in the USA was very bad and triggered a clear change of script, going from expecting 7 falls of 0.25% during 2024 to only one or two. The US economy continues to show great strength thanks to the government's continued fiscal stimulus and a labour market with an unemployment rate below 4%. In contrast, it seems quite clear that the ECB is in a different momentum and can almost certainly guarantee that it will start lowering rates in June and again before October. Looking at the main European indices, the Eurostoxx 50 closed down -3.19%, the German DAX -3.03%, the French CAC -2.69%, the Italian MIB -2.89% and finally the Spanish selective Ibex-35 with -1.99%. Sectoral, this month there were no clear winners such as the financial sectors with a rise of 3.96% and Energy with 3.90%, there were sectors with flat performances such as Health and Utilities and on the losing side the technology sector fell by -4.52% and above all autos by -5.31%. As for the main American benchmark indices, they followed the same trend as their European counterparts and also had a poor monthly performance, with the S&P 500, the Nasdaq and the Dow Jones index closing April with monthly losses of -4.16%, -4.41% and -5% respectively. Uncertainty over the future of the Palestinian conflict caused oil prices to fall -1.49% after three months of consecutive rises, leaving the price of a barrel at 81.93 dollars. Gold continued its year-long advance, hitting record highs at one point in the month to close up 2.53% at \$2,286.25/oz. The euro declined again for the fourth consecutive month, down -1.15% to close at 1.0666. The US 10-year Treasury yields moved higher demonstrating the change in the market's visibility of interest rate cuts and closed at 4.68% coming from the 4.20% level. The German 10-year Bund had a similar movement to the Treasury and for part of the month managed to rise to highs of 2.63% to end the month at 2.58%.

Fund Performance

The Fund's performance in March was negative -0.38%, which represents a cumulative return of 2.73% for the year. The poor performance of the equity markets detracted from the Fund's performance, although to a lesser extent thanks to the Fund's hedging. Looking at the analysis of the fund's long portfolio, the indexed part had a negative impact on the fund, with negative contributions of -0.32% by the Eurostoxx50 ETF, -0.29% by the Global ETF, -0.29% by the French index and -0.14% by the French ETF and -0.07% by the Italian MIB index. On the sectoral side, the financial sector performed well with a contribution of 0.16%, Health Care and Utilities were flat and the technology sector had a negative contribution of -0.14%. In terms of the management universe, the different factors delivered mixed performances, while the Momentum and Quality factors had a negative performance with contributions of -0.03% and the Value factor contributed positively by 0.02%. The current hedging component added about 1.76% to the fund's performance.

Investment perspectives and strategy

As we leave the first quarter of the year behind and start the new one in the opposite way, bad data and perhaps a sense of a certain calm have finally pushed yields in the main markets back. Since the Federal Reserve started to increase interest rates in 2022 and subsequently the various central banks, investors have repeatedly bet on a normalisation of inflation, with normalisation being understood as reaching a target of 2%, however, it does not seem that it will come as easily as expected as the last CPI data published in the United States was very bad and unleashed a storm in the markets, which in four months have gone from discounting six or even seven 0.25% decreases for 2024 to just one or two. We have been keeping a close eye, because of the impact of their results, on the publications of the select group of the Magnificent 7, where Tesla showed weak results in contrast to Meta and Google which posted strong gains in contrast to Amazon which showed mixed results. The markets continued to follow geopolitical developments in the Middle East. In the aftermath of Iran's bombing of Israel, the international community waged a campaign on all fronts to dissuade Israel from responding with an armed escalation that would provoke open war between the two countries. Israel's subdued response seems to have averted the risk of all-out war in the region, though much doubt and uncertainty remains. Meanwhile, the US House of Representatives this weekend gave the green light to an aid package for Ukraine, Israel and other US allies. It is worth noting that gold has set new record highs this month in an increasingly uncertain geopolitical environment and with inflation that has not returned to 2% levels, with China and India among its main buyers, the question is what if China wanted to accumulate a sufficiently large amount of gold in the long term to be able to back its currency, the yuan, in the same way as the US did before abandoning the gold standard? But today the dollar is still showing its strength against other currencies. As we were warning the market seemed absent of negative news and did not seem to price in the risk of a change in the economic outlook. From now on we must be attentive to the data coming out in order to consolidate the confidence generated or to adapt to a new environment of changes.

Glossary:

Sharpe ratio: The Sharpe ratio measures the excess return relative to the risk-free rate divided by the standard deviation of this return. This is an indicator of marginal return per unit of risk. If the Sharpe ratio is positive, the higher the risk will pay.

Net Asset Value: is the price of a stake in an investment fund.

Volatility: Volatility is the most accepted measure by the market to mathematically represent the risk of a financial asset in a given period. Volatility is often measured in statistical terms through the standard deviation (it indicates how, on average, a fund's return has deviated from the average return over the observation time horizon). We represent the 1-year volatility of the Reference Funds.

TER: The TER is the total expenditure ratio. Investment funds are obliged to stipulate by law their main commissions. The TER covers all the expenses involved in a fund: 1. Management 2. Deposit 3. Success Commission 4. Legal Fees 5. Audit committees 6. Other expenses

Fund main risks:

Interest rate risk: it is the risk that the price of a security that accrues a fixed interest is affected by an increase in market interest rates. Generally, increases in market interest rates negatively influence the price of an obligation and average the duration of the security (the longer the life of the security, the greater the increase in risk). Interest rate risk may result in a decrease in the net asset value of the Fund.

Liquidity risk: An investor may encounter restrictions when it comes to undoing the positions in which he has invested. This usually happens when trading outside of organized markets, in very specific securities with low trading levels. The lack of liquidity can influence the sale price and, therefore, condition the profitability of the operation.

Exchange rate risk: This results from the value of a fund's positions being adversely affected by exchange rate movements between the currency in which the fund is denominated and the currency of the assets in which the funds invest.

Equities: there is a risk that the price changes of the shares that make up the fund may be conditioned by external economic factors, by the volume of the securities traded and by the level of capitalization of the company may and this may negatively influence the performance of the Fund.

Derivatives: The Fund uses derivative instruments in its strategy as a hedging mechanism. There is a risk that investment in derivatives (futures, options, etc.) may incorporate greater risk given the nature of these products.
